Infinite, parallel chains with gap:  $\Delta E_g = 2(\beta - \beta')$ 

◆□ > ◆□ > ◆豆 > ◆豆 > ・豆 ・ の Q @ >

SAPT(DFT) Interaction of  $(H_2)_n$  chains using SAPT(DFT) (symmetry-adapted perturbation theory based on DFT).

- ▶ Finite chains: *n* = 2, 4, 8, 16, 32
- ► Control HOMO-LUMO gap using bond alternation.  $\eta = y/x$ .

◆□▶ ◆□▶ ◆□▶ ◆□▶ → □ ◇ ◇ ◇

► Gap goes from 10 eV (smallest chain) to 1 eV.

 SAPT(DFT) dispersion is calculated using the generalized Casimir-Polder expression (Longuet-Higgins (1965)):

$$E_{\rm disp}^{(2)} = -\frac{1}{2\pi} \int_0^\infty dw \int \frac{\alpha_A(\mathbf{r}_1, \mathbf{r'}_1; iw) \alpha_B(\mathbf{r}_2, \mathbf{r'}_2; iw)}{|\mathbf{r}_1 - \mathbf{r}_2| |\mathbf{r'}_1 - \mathbf{r'}_2|} d\mathbf{r}_1 d\mathbf{r'}_1 d\mathbf{r}_2 d\mathbf{r'}_2$$

Where  $\alpha(\mathbf{r}, \mathbf{r}'; \omega)$  is the frequency-dependent density susceptibility function (FDDS).

 Advantages of perturbation theory: separate out the dispersion from the long-range electrostatics. Bond alternation:  $\eta = y/x = 2$ ,  $E_g = 0.366$  a.u.

◆□ > ◆□ > ◆豆 > ◆豆 > ・豆 - のへぐ

Bond alternation:  $\eta = y/x = 1$ ,  $E_g = 0.057$  a.u.

◆□ > ◆□ > ◆豆 > ◆豆 > ・豆 - のへぐ

Bond alternation:  $\eta = y/x$ 

・ロト ・聞ト ・ヨト ・ヨト

-2

- No single power law.
- Two regions (distances in a.u.):

 $z^{-6}$ : for  $z \gg L$  $z^{-x}$ : x < 5 for 6 < z < 20.

The anomalous power law occurs at physically important separations.

- Enhanced dispersion: At z = 40 a.u. (roughly half chain length), two orders of magnitude between chains with  $\eta = 1$  and  $\eta = 2$ .
- Enhancement orders of magnitude less than for the Hučkel chains: importance of screening.

 Non-additivity of total polarizabilities can explain three order of magnitude enhancement at very long range. Longitudinal static polarizabilities for (H<sub>2</sub>)<sub>32</sub> chains:

$$\frac{\alpha(\eta = 1.0)}{\alpha(\eta = 2.0)} = \frac{11589}{415} = 28\tag{4}$$

▲ロト ▲帰 ト ▲ヨト ▲ヨト - ヨ - の々ぐ

Dispersion energy depends quadratically on the polarizability.

- But extrapolation to intermediate distances overestimates dispersion by orders of magnitude.
- Failure of additivity.
- Not damping or retardation.
- Severe finite-size effects...

#### Multipole Expansion

At the time, I had been working on very accurate multipole expansions for the dispersion energy using WSM method (available in the CAMCASP program):

$$E_{\rm disp}^{(2)} = -\sum_{a,b} \left( \frac{C_6^{ab}}{R_{ab}^6} + \frac{C_7^{ab}}{R_{ab}^7} + \frac{C_8^{ab}}{R_{ab}^8} + \cdots \right)$$
(5)

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Based on density-response functions calculated using linear-response TD-DFT.
- Consistent with SAPT(DFT) dispersion energies.
- ► Very accurate models. R.m.s. errors of 0.5 kJ mol<sup>-1</sup> across large energy ranges (-40 to 0 kJ mol<sup>-1</sup>).

Pyridine dimer: WSM dispersion models (damped).

◆□ > ◆□ > ◆豆 > ◆豆 > 「豆 」のへで

#### Multipole Expansion

- For z > 6 a.u.: Density overlap is negligible. So multipole expansion should be valid.
- Usually we take this to mean that

$$E_{\rm disp}^{(2)} = -\sum_{a,b} \frac{C_6^{ab}}{R_{ab}^6}.$$
 (6)

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- But this cannot yield an effective power law with exponent less than 5.
- Nor can the more general expression:

$$E_{\rm disp}^{(2)} = -\sum_{a,b} \left( \frac{C_6^{ab}}{R_{ab}^6} + \frac{C_7^{ab}}{R_{ab}^7} + \frac{C_8^{ab}}{R_{ab}^8} + \cdots \right)$$
(7)

where each coefficient is angular dependent.

Introduction

► Longuet-Higgins (1965) expression for the dispersion energy:

$$E_{\rm disp}^{(2)} = -\frac{1}{2\pi} \int_0^\infty dw \int \frac{\alpha_A(\mathbf{r}_1, \mathbf{r'}_1; iw) \alpha_B(\mathbf{r}_2, \mathbf{r'}_2; iw)}{|\mathbf{r}_1 - \mathbf{r}_2| |\mathbf{r'}_1 - \mathbf{r'}_2|} d\mathbf{r}_1 d\mathbf{r'}_1 d\mathbf{r}_2 d\mathbf{r'}_2$$

Taylor expansion (systems separated by R): Leading order term is usually written as the dipole-dipole interaction:

$$\frac{1}{|\mathbf{r} - \mathbf{r}'|} = -\hat{\mu}_{\alpha} \frac{3R_{\alpha}R_{\beta} - R^2\delta_{\alpha\beta}}{R^5}\hat{\mu}_{\beta}$$
(8)

But this is insufficient. It leads to the usual  $-C_6R^{-6}$  form. • Generalize:

$$\frac{1}{|\mathbf{r} - \mathbf{r}'|} = \hat{Q}_t^A \mathcal{T}_{tu}^{AB} \hat{Q}_u^B \tag{9}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

where t = 00, 10, 11c, 11s, ... label the rank of the multipole moment operators.

- A T-function of ranks *I* and *I'* behaves like  $R^{-I-I'-1}$ .
- Distribute: For extended systems use multiple centres:

$$\frac{1}{|\mathbf{r} - \mathbf{r}'|} = \sum_{a} \sum_{b} \hat{Q}_t^a T_{tu}^{ab} \hat{Q}_u^b.$$
(10)

Inserting this in the Longuet-Higgins expression gives:

$$E_{\rm disp}^{(2)} = -\frac{1}{2\pi} \sum_{a,a'} \sum_{b,b'} T_{tu}^{ab} T_{t'u'}^{a'b'} \int_0^\infty \alpha_{tt'}^{aa'}(iw) \alpha_{uu'}^{bb}(iw) dw \quad (11)$$

where the non-local polarizabilities are defined as

$$\alpha_{tt'}^{aa'}(\omega) = \iint \hat{Q}_t^a(\mathbf{r})\alpha(\mathbf{r},\mathbf{r}';\omega)\hat{Q}_{t'}^{a'}(\mathbf{r}')d\mathbf{r}d\mathbf{r}' \qquad (12)$$

This is the correct multipole expansion for the dispersion. For details see Stone 'The Theory of Intermolecular Forces' (1996).

- To obtain the usual expansion we must *localize* the non-local polarizabilities. This is usually done by another multipole expansion, but there are other methods.
- The result is that only terms involving the same site remain.
- This is an approximation that assumes that

$$\alpha^{aa'} \sim e^{-\gamma |R_{aa'}|},\tag{13}$$

where  $\gamma \sim 1$ .

When this is true, the localization is valid and we get

$$E_{\rm disp}^{(2)} = -\frac{1}{2\pi} \sum_{a} \sum_{b} T_{tu}^{ab} T_{t'u'}^{ab} \int_{0}^{\infty} \alpha_{tt'}^{a} (iw) \alpha_{uu'}^{b} (iw) dw$$
$$= -\sum_{a} \sum_{b} \left( \frac{C_{6}^{ab}}{R_{ab}^{6}} + \frac{C_{7}^{ab}}{R_{ab}^{7}} + \frac{C_{8}^{ab}}{R_{ab}^{8}} + \cdots \right)$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

Pyridine dimer: WSM dispersion models (damped).

◆□ > ◆□ > ◆豆 > ◆豆 > 「豆 」のへで

What are the non-local polarizabilities?

- The lowest rank polarizability is  $\alpha_{00,00}^{aa'}$ .
- If V<sup>a</sup> is the potential at site a, the change in charge at site a is given by

$$\Delta \hat{Q}_{00}^{a} = -\sum_{a'} \alpha_{00,00}^{aa'} (V^{a'} - V^{a}).$$
(14)

- So such terms describe the flow of charge in response to a potential. They are therefore termed *charge-flow* polarizabilities.
- These are the analogue of the low (zero) frequency plasmon modes.
- They contribute  $R^{-2}$  terms to the dispersion energy.

Sum rule: Charge conservation requires that

$$\int \alpha(\mathbf{r}, \mathbf{r}'; \omega) d\mathbf{r}' = 0, \qquad (15)$$

and this results in the charge-flow sum rule

$$\sum_{a'} \alpha_{t,00}^{aa'} = 0.$$
 (16)

◆□ > ◆□ > ◆臣 > ◆臣 > ○臣 ○ のへ⊙

Charge-flow contribution to the dispersion energy:

$$E_{\rm disp}^{(2)}(00,00) = -\frac{1}{2\pi} \sum_{aa',bb'} \frac{1}{R_{ab}R_{a'b'}} \int_0^\infty \alpha_{00,00}^{aa'}(iw) \alpha_{00,00}^{bb'}(iw) dw$$
(17)

- $z \leq L_c$ : Large  $R^{-2}$  contribution.
- ► L<sub>c</sub> ≪ z < L: Charge-fluctuations small compared to R<sub>ab</sub> and only R<sub>a'b'</sub> close to R<sub>ab</sub> contribute...(see fig)...

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 $\blacktriangleright$   $L_c \ll z < L$ :

$$E_{\rm disp}^{(2)}(00,00) = -\frac{1}{2\pi} \sum_{aa',bb'} \frac{1}{R_{ab}R_{a'b'}} \int_0^\infty \alpha_{00,00}^{aa'}(iw) \alpha_{00,00}^{bb'}(iw) dw$$
$$\approx -\frac{1}{2\pi} \sum_{ab} \frac{1}{R_{ab}R_{ab}}$$
$$\int_0^\infty \left( \sum_{a'} \alpha_{00,00}^{aa'}(iw) \right) \left( \sum_{b'} \alpha_{00,00}^{bb'}(iw) \right) dw$$
$$= 0$$
(18)

But higher-order terms are non-zero.

- L ≪ z: In this limit both R<sub>ab</sub> and R<sub>a'b'</sub> can be expanded in a multipole expansion about R = (0,0,z):
  - ►  $R_{ab}^{-1} = |\mathcal{R} (\mathbf{r}_a \mathbf{r}_b)|^{-1} = |\mathcal{R} \mathbf{r}_{ab}|^{-1} \approx z^{-1} \frac{1}{2}r_{ab}^2 z^{-3}$
  - Use sum-rule.

$$E_{\rm disp}^{(2)}(00,00) \approx -\frac{1}{2\pi} \frac{1}{4z^6} \sum_{aa'} \sum_{bb'} r_{ab}^2 r_{a'b'}^2 \times \int_0^\infty \alpha_{00,00}^{aa'}(iw) \alpha_{00,00}^{bb'}(iw) dw \\ \equiv -\frac{C_6(00,00)}{z^6}.$$
 (19)

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Angyan (2007,2009) has shown that the charge-flow polarizabilities are related to the the XC-hole by relating the density autocorrelation function

$$S(\mathbf{r},\mathbf{r}') = \rho(\mathbf{r})\delta(\mathbf{r}-rp) + \rho(\mathbf{r})h_{xc}(\mathbf{r},\mathbf{r}')$$
(20)

to the FDDS using the Unsold approximation:

$$\alpha(\mathbf{r},\mathbf{r}';\mathbf{0}) = \frac{\pi}{\hbar\bar{\omega}} S(\mathbf{r},\mathbf{r}').$$
(21)

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Therefore,

$$\begin{aligned} \alpha_{00,00}^{aa'} &= \int_{\Omega_a} \int_{\Omega_{a'}} \alpha(\mathbf{r}, \mathbf{r}'; 0) d\mathbf{r} d\mathbf{r}' \\ &= \frac{\pi}{\hbar \bar{\omega}} \left( N_a \delta_{aa'} + \int_{\Omega_a} \rho(\mathbf{r}) \int_{\Omega_{a'}} h_{xc}(\mathbf{r}, \mathbf{r}') d\mathbf{r} d\mathbf{r}' \right) \end{aligned}$$

Analysis

- ► Failure of additivity (and the pair-wise -C<sub>6</sub>/R<sup>6</sup> model) as the gap decreases and system length increases.
- Require explicit non-local terms. This non-locality is contained in the full density response function α(r, r'; ω).
- ► The non-local charge-flow terms do two things: (1) change the power-law for the interaction, and (2) enhance the dispersion interaction.
